Yasur volcano (Tanna Island, Vanuatu) activity update: ash emissions, weak strombolian explosions

Wed, 20 Nov 2013, 06:31
06:31 AM | BY: T

Geohazards reports that the volcano continues to produce near-continuous ash emissions while explosions are relatively weak. This phase of ash emissions began on 3 November and are likely to continue into the coming days and weeks.

Yasur Alert Level is still maintained at Level 1.

Villages and communities located close and far away from the volcano, especially those in the prevailing trade winds direction (NW) are likely to receive ash falls.

SUPPORT US - HELP US UPGRADE OUR SERVICES!

We truly love working to bring you the latest volcano and earthquake data from around the world. Maintaining our website and our free apps does require, however, considerable time and

resources.

We need financing to increase hard- and software capacity as well as support our editor team. We're aiming to achieve uninterrupted service wherever an earthquake or volcano eruption unfolds, and your donations can make it happen! Every donation will be highly appreciated. If you find the information useful and would like to support our team in integrating further features, write great content, and in upgrading our soft- and hardware, please make a donation ([PayPal](#) or [Online credit card payment](#)).

Planned features:

- Improved multilanguage support
- Tsunami alerts
- Faster responsiveness

Thanks to your past donations, these features have been added recently:

- Design upgrade
- Detailed quake stats
- Additional seismic data sources

Download and Upgrade the Volcanoes & Earthquakes app to get one of the fastest seismic and volcano alerts online:
